

Department of Computer Science & Engineering

IV SEMESTER

STUDENTS LAB MANUAL

for

**DATA COMMUNICATION AND NETWORKING
LABORATORY**

Subject code: CSL47

Course Credits 0:0:1

Term: March - June 2025

Faculties Incharge:

Nandini S B

Dr. Sangeetha V

Soumya C S

Syllabus

Sl. No	Tools/ Environment	Cycle I	Page No.
1.	Wireshark	Trace Hypertext Transfer Protocol using Wireshark	5
2.	Wireshark	Trace Domain Name Server using Wireshark.	12
3.	Wireshark	Trace Internet Protocol and Internet Control Message Protocol using Wireshark.	16
4.	Wireshark	Trace Dynamic Host Configuration Protocol using Wireshark.	20
5.	C/C++/Java	Write a program for error detection using CRC-CCITT(16-bits).	25
6.	C/C++/Java	Write a program to find the shortest path between vertices using Bellman-Ford algorithm.	28
7.	C/C++/Java	Write a program for congestion control using leaky bucket algorithm.	32
Cycle II			
8.	C/C++/Java	Using TCP/IP sockets, write a client – server program where the client send the file name and the server send back the contents of the requested file if present.	35
9.	C/C++/Java	Write a program for Time Division Multiplexing Simulator. Show how the time division multiplexing technique works.	38
10.	Network Simulator - 3	Design and simulate a wired network with duplex links between ‘n’ nodes with CDR over UDP. Set the queue size vary the bandwidth and find the number of packets dropped.	42
11.	Network Simulator - 3	Design and simulate a four node point-to-point network, and connect the links as follows: n0-n2, n1-n2 and n2-n3. Apply TCP agent between n0-n3 and UDP agent between n1-n3. Apply relevant applications over TCP and UDP agents by changing the parameters and determine the number of packets sent by TCP/UDP.	45
12.	Network Simulator - 3	Design and simulate simple Extended Service Set with transmitting nodes in wireless LAN and determine the performance with respect to transmission of Packets.	50
13.	Network Simulator - 3	Design and simulate infrastructure less network, generate two traffic flows between nodes and analyse its performance.	56
14.	Network Simulator - 3	Design a wired network with ‘n’ nodes to observe the performance of two TCP variants (Reno and Tahoe). Simulate the designed network and observe the network performance.	61

Introduction to Wireshark:

Wireshark is a widely used, open source network analyser that can capture and display real-time details of network traffic. It is particularly useful for troubleshooting network issues, analysing network protocols and ensuring network security. Wireshark is one such tool that can offer an in-depth view into network activities, diagnose network performance issues or identify potential security threats.

Wireshark is a **network protocol analyzer**, which means it's a tool used to capture and analyze the data traffic on a computer network in real-time. It's widely used by network administrators, security professionals, developers, and even hobbyists to troubleshoot network issues, monitor network activity, and analyze security problems.

Key Features:

- **Packet Capture:** Captures packets (units of data) as they travel across a network.
- **Detailed Analysis:** Decodes and displays protocols at various levels of the OSI model (like TCP, HTTP, DNS).
- **Filtering:** Powerful display filters help narrow down exactly what you're looking for.
- **Live Capture and Offline Analysis:** You can watch traffic as it happens or open saved packet capture files.
- **Cross-Platform:** Works on Windows, macOS, and Linux.

How to Install:

Linux (Ubuntu/Debian)

Step 1: Open a terminal and run

```
sudo apt update  
  
sudo apt install wireshark
```

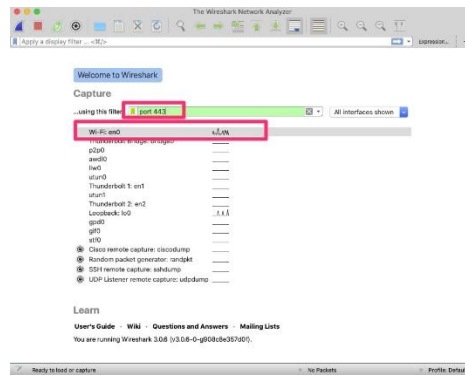

Step 2: During installation, you'll be prompted about allowing non-root users to capture packets. If you say "Yes", add your user to the wireshark group

```
sudo usermod -aG wireshark $USER
```

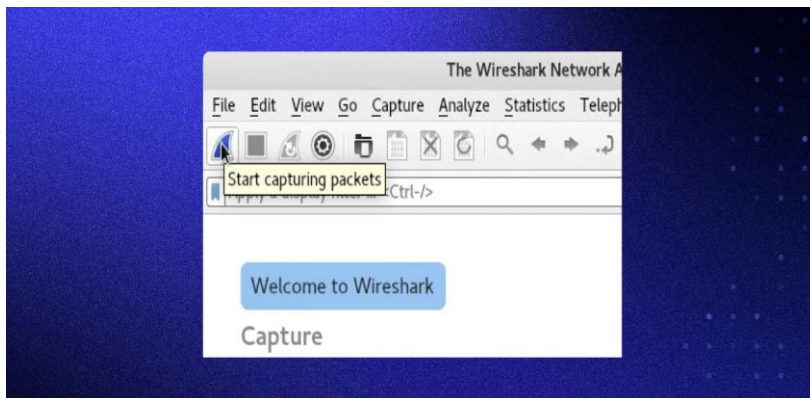

Step 3: Log out and log back in for the group change to take effect.

After Installation

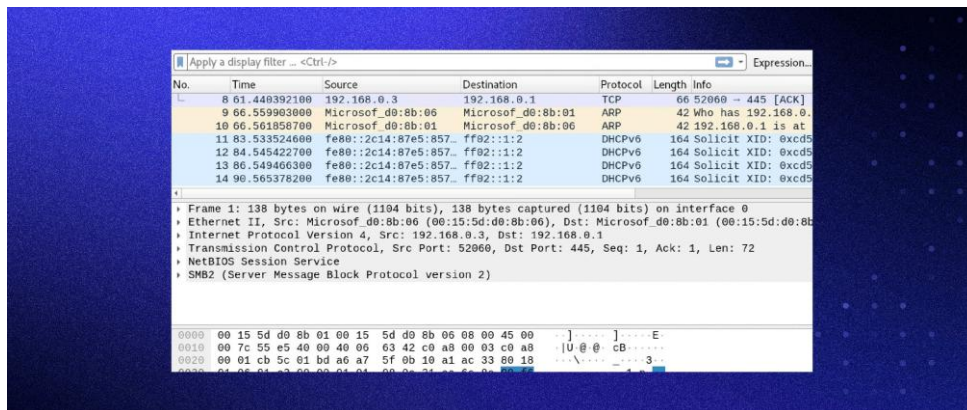

- Launch Wireshark.
 - Open Terminal: `sudo wireshark`.
- You'll see a list of network interfaces (like Ethernet, Wi-Fi).

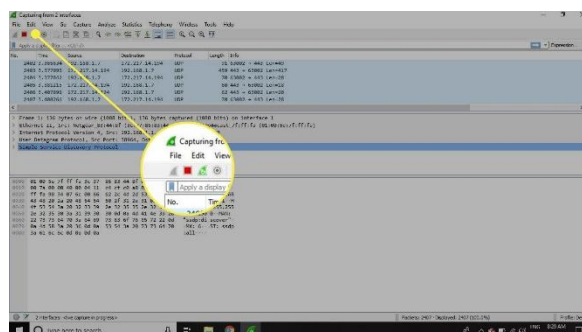

- Select one and click **Start capturing packets**.

- Packet capturing starts:

- Stop Capturing

Cycle - 1

Lab Session 1

Problem Statement: Trace Hypertext Transfer Protocol using Wireshark

Exercise Question with Solution:

Trace Hypertext Transfer Protocol. (Part A)

The Basic HTTP GET/response interaction

Let's begin exploration of HTTP by downloading a very simple HTML file - one that is very short, and contains no embedded objects. Do the following:

1. Start web browser.
2. Start Wireshark packet sniffer(but don't begin packet capture).
3. Enter "http" in the display-filter-specification window
4. Wait a bit more than one minute, and then begin Wireshark packet capture.
5. Enter the following to your browser

<http://gaia.cs.umass.edu/wireshark-labs/HTTP-wireshark-file1.html>

browser should display the very simple, one-line HTML file.

- a) Is your browser running HTTP version 1.0 or 1.1? What version of HTTP is the server running?

```
Hypertext Transfer Protocol
GET /wireshark-labs/HTTP-wireshark-file1.html HTTP/1.1\r\n
Host: gaia.cs.umass.edu\r\n
User-Agent: Mozilla/5.0 (Windows; U; Windows NT 6.1; en-US; rv:1.9.2.11) Gecko/20101012 Firefox/3.5.1\r\n
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8\r\n
Accept-Language: en-us,en;q=0.5\r\n
Accept-Encoding: gzip, deflate\r\n
Accept-Charset: ISO-8859-1,utf-8;q=0.7,*;q=0.7\r\n
Keep-Alive: 115\r\n
Connection: keep-alive\r\n
\r\n
```

- b) What languages does your browser indicate that it can accept from the server?

```
Hypertext Transfer Protocol
GET /wireshark-labs/HTTP-wireshark-file1.html HTTP/1.1\r\n
Host: gaia.cs.umass.edu\r\n
User-Agent: Mozilla/5.0 (Windows; U; Windows NT 6.1; en-US; rv:1.9.2.11) Gecko/20101012 Firefox/3.5.1\r\n
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8\r\n
Accept-Language: en-us,en;q=0.5\r\n
Accept-Encoding: gzip, deflate\r\n
Accept-Charset: ISO-8859-1,utf-8;q=0.7,*;q=0.7\r\n
Keep-Alive: 115\r\n
Connection: keep-alive\r\n
\r\n
```

- c) What is the status code returned from the server to your browser?

```
No.    Time           Source             Destination        Protocol  Info
135    4.126437       128.119.245.12     192.168.1.101     HTTP     HTTP/1.1 200 OK (text/html)

\r\n
[Request in frame: 5203]
[Time since request: 0.311639000 seconds]
[Request URI: /wireshark-labs/HTTP-wireshark-file1.html]
[Full request URI: http://gaia.cs.umass.edu/wireshark-labs/HTTP-wireshark-file1.html]
File Data: 128 bytes
v Line-based text data: text/html (4 lines)
<html>\n
Congratulations. You've downloaded the file \n
http://gaia.cs.umass.edu/wireshark-labs/HTTP-wireshark-file1.html!\n
</html>\n
```

The HTTP CONDITIONAL GET/response interaction

Perform the following:

- Start up your web browser, and make sure your browser's cache is cleared
- Start up the Wireshark packet sniffer.
- Enter the following URL into your browser
`http://gaia.cs.umass.edu/wireshark-labs/HTTP-wireshark-file2.html`
- Your browser should display a very simple five-line HTML file.
- Open a new tab on the same browser and enter the same URL again

- f) Inspect the contents of the first HTTP GET request from your browser to the server.
Do you see an "IF-MODIFIED-SINCE" line in the HTTP GET?

Answer is NO

```
> Frame 384: 784 bytes on wire (6272 bits), 784 bytes captured (6272 bits) on interface \Device\NPF_{34
> Ethernet II, Src: Intel_9f:11:fc (3c:fd:fe:9f:11:fc), Dst: Intel_f4:c6:b7 (40:ec:99:f4:c6:b7)
> Internet Protocol Version 4, Src: 128.119.245.12, Dst: 10.10.4.158
> Transmission Control Protocol, Src Port: 80, Dst Port: 60227, Seq: 1, Ack: 487, Len: 730
> Hypertext Transfer Protocol
  > HTTP/1.1 200 OK\r\n
    Date: Thu, 20 Mar 2025 05:43:35 GMT\r\n
    Server: Apache/2.4.6 (CentOS) OpenSSL/1.0.2k-fips PHP/7.4.33 mod_perl/2.0.11 Perl/v5.16.3\r\n
    Last-Modified: Thu, 20 Mar 2025 05:43:01 GMT\r\n
    ETag: "173-630bf9c6c87c4"\r\n
    Accept-Ranges: bytes\r\n
  > Content-Length: 371\r\n
    Keep-Alive: timeout=5, max=100\r\n
    Connection: Keep-Alive\r\n
    Content-Type: text/html; charset=UTF-8\r\n
    \r\n
    [Request in frame: 312]
    [Time since request: 2.868239000 seconds]
```

- g) Inspect the contents of the server response. Did the server explicitly return the contents of the file? How can you tell?

Answer is Yes

```
[Full request URI: http://gaia.cs.umass.edu/wireshark-labs/HTTP-wireshark-file2.html]
File Data: 371 bytes
▼ Line-based text data: text/html (10 lines)
  \n
  <html>\n
  \n
  Congratulations again! Now you've downloaded the file lab2-2.html. <br>\n
  This file's last modification date will not change. <p>\n
  Thus if you download this multiple times on your browser, a complete copy <br>\n
  will only be sent once by the server due to the inclusion of the IN-MODIFIED-SINCE<br>\n
  field in your browser's HTTP GET request to the server.\n
  \n
  </html>\n
```

- h) Now inspect the contents of the second HTTP GET request from your browser to the server. Do you see an “IF-MODIFIED-SINCE:” line in the HTTP GET? If so, what information follows the “IF-MODIFIED-SINCE:” header?

Answer is Yes

```
▼ Hypertext Transfer Protocol
> GET /wireshark-labs/HTTP-wireshark-file2.html HTTP/1.1\r\n
Host: gaia.cs.umass.edu\r\n
Connection: keep-alive\r\n
Cache-Control: max-age=0\r\n
Upgrade-Insecure-Requests: 1\r\n
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/134.0.0.0 Safari/537.36 Edg/134.0.0.0\r\n

> Hypertext Transfer Protocol
> eXtensible Markup Language
```

- c) What is the status code and phrase associated with the response to the HTTP GET Request?

Answer is 304 Not modified

No.	Time	Source	Destination	Protocol	Length	Info
811	23.246635	172.1.14.93	128.119.245.12	HTTP	613	GET /wireshark-labs/HTTP-wireshark-file3.html HTTP/1.1
831	23.521732	128.119.245.12	172.1.14.93	HTTP	295	HTTP/1.1 304 Not Modified

HTML Documents with Embedded Objects

Perform the following:

- Start up your web browser, and make sure your browser's cache is cleared
- Start up the Wireshark packet sniffer.
- Enter the following URL into your browser

<http://gaia.cs.umass.edu/wireshark-labs/HTTP-wireshark-file4.html>

Note: Your browser should display a short HTML file with two images.

These two images are referenced in the base HTML file.

That is, the images themselves are not contained in the HTML; instead the URLs for the images are contained in the downloaded HTML file.

Your browser will have to retrieve these logos from the indicated web sites.

1. The publisher's logo is retrieved from the www.aw-bc.com web site.
2. The image of the book's cover is stored at the manic.cs.umass.edu server.

- d) How many HTTP GET request messages were sent by your browser? To which Internet addresses were these GET requests sent?

Answer is 3

No.	Time	Source	Destination	Protocol	Length	Info
998	19.745525	172.1.14.93	128.119.245.12	HTTP	526	GET /wireshark-labs/HTTP-wireshark-file4.html HTTP/1.1

HTTP Authentication

URL:

http://gaia.cs.umass.edu/wireshark-labs/protected_pages/HTTP-wireshark-file5.html

username: wireshark-students

password: network

- f) What is the server's response (status code and phrase) in response to the initial HTTP GET message from your browser?

Answer is 401 unauthorized

- g) When your browser sends the HTTP GET message for the second time, what new field is included in the HTTP GET message?

```
> Frame 1042: 627 bytes on wire (5016 bits), 627 bytes captured (5016 bits) on interface \Device\NPF_{...}
> Ethernet II, Src: HP_07:ed:20 (b0:5c:da:07:ed:20), Dst: DLinkInterna_29:72:9f (c4:e9:0a:29:72:9f)

Lab Session 2

Problem Statement: Trace Domain Name Server using packet sniffer and packet analyser.

Exercise Question with Solution:

- Start packet capture in Wireshark.
- With your browser, visit the Web page: <http://www.ietf.org>

a) Locate the DNS query and response messages. Are they sent over UDP or TCP?

• DNS Query and Response sent over UDP

The image shows two Wireshark packet capture windows. The left window shows a list of packets with a red arrow pointing from the text 'Request Query' to packet 911 (Standard query 8635d). Another red arrow points from 'UDP' to the same packet. A third red arrow points from 'Response' to packet 912 (Standard query response 8635d). The right window shows the details pane for packet 911, highlighting the 'User Datagram Protocol' section, which confirms it is a UDP packet.

b) What is the destination port for the DNS query message? What is the source port of DNS response message?

The image shows two Wireshark packet capture windows. The left window shows the details pane for packet 911, highlighting the 'Destination Port: 53' field. A red arrow points from the text 'Destination Port= 53' to this field. The right window shows the details pane for packet 912, highlighting the 'Source Port: 53' field. A red arrow points from the text 'Source Port= 53' to this field.

- c) To what IP address is the DNS query message sent? Determine the IP address of your local DNS server (*Hint: nmcli*). Are these two IP addresses the same?

```
msrit@msrit:~$ nmcli device show
GENERAL.DEVICE:                               eno1
GENERAL.TYPE:                                  ethernet
GENERAL.HWADDR:                                2C:F0:5D:17:6C:F1

Name, Value, Type, TTL

- f) Consider the subsequent TCP SYN packet sent by your host. Does the destination IP address of the SYN packet correspond to any of the IP addresses provided in the DNS response message?

ANSWER: The first SYN packet was sent to 209.173.57.180 which corresponds to the first IP address provided in the DNS response message.

- g) This web page contains images. Before retrieving each image, does your host issue new DNS queries?

Answer: No

Do an nslookup on www.mit.edu

Type the command nslookup -type=NS mit.edu

```
msrit@msrit:~$ nslookup -type=NS mit.edu
Server:      127.0.0.53
Address:     127.0.0.53#53

Non-authoritative answer:
mit.edu nameserver = ns1-173.akam.net.
mit.edu nameserver = use2.akam.net.
mit.edu nameserver = ns1-37.akam.net.
mit.edu nameserver = use5.akam.net.
mit.edu nameserver = usw2.akam.net.
mit.edu nameserver = asia1.akam.net.
mit.edu nameserver = asia2.akam.net.
mit.edu nameserver = eur5.akam.net.

Authoritative answers can be found from:
```

- h) To what IP address is the DNS query message sent? Is this the IP address of your default local DNS server?

No.	Time	Source	Destination	Protocol	Length	Info
106	35.158418585	172.1.6.75	172.1.2.2	DNS	67	Standard query 0xcdf1 NS mit.edu
107	35.195042085	172.1.2.2	172.1.6.75	DNS	234	Standard query response 0xcdf1 NS mit.edu NS ns1-37.akam.net NS asia
136	44.415939977	172.1.6.75	172.1.2.2	DNS	89	Standard query 0x1341 AAAA connectivity-check.ubuntu.com
137	44.416355679	172.1.2.2	172.1.6.75	DNS	425	Standard query response 0x1341 AAAA connectivity-check.ubuntu.com AA

172.1.2.2

- i) Examine the DNS query message. What “Type” of DNS query is it? Does the query message contain any “answers”?

- NS
- No

The image shows a Wireshark packet capture. The top part is a packet list with columns: No., Time, Source, Destination, Protocol, Length, Info. It shows a DNS query (No. 106) from 172.1.6.75 to 172.1.2.2 and a DNS response (No. 107) from 172.1.2.2 to 172.1.6.75. Below the packet list is the packet details pane. A red arrow points from the 'NS' bullet to the 'Standard query' field in the packet details. Another red arrow points from the 'No' bullet to the 'Questions: 1' field in the packet details.

- j) Examine the DNS response message. What MIT name servers does the response message provide? Does this response message also provide the IP addresses of the MIT name servers?

No.	Time	Source	Destination	Protocol	Length	Info
106	35.158418585	172.1.6.75	172.1.2.2	DNS	67	Standard query 0xcdf1 NS mit.edu

Lab Session 3

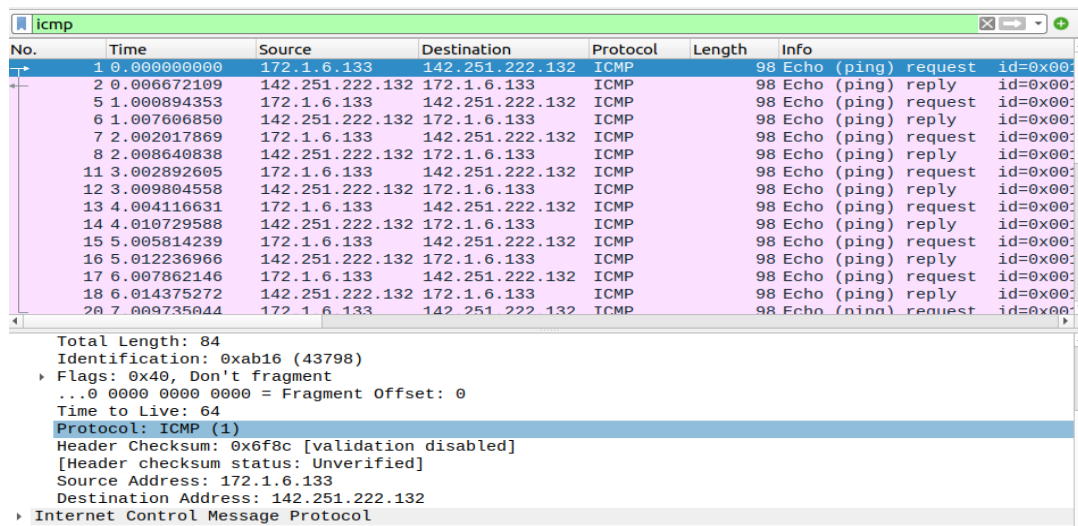

Problem Statement: Trace Internet Protocol and Internet Control Message Protocol using Wireshark.

Exercise Question with Solution:

- a) Select the first ICMP Echo Request message sent by your computer, and expand the Internet Protocol part of the packet in the packet details window. What is the IP address of your computer?

- b) Within the IP packet header, what is the value in the upper layer protocol field?

- c) How many bytes are in the IP header? How many bytes are in the payload of the IP datagram? Explain how you determined the number of payload bytes.

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000000	172.1.6.133	142.251.222.132	ICMP	98	Echo (ping) request id=0x00000000

- f) Which fields stay constant?

Answer: The fields that stay constant across the IP datagrams are:

- Version (since we are using IPv4 for all packets)
- header length (since these are ICMP packets)
- source IP (since we are sending from the same source)
- destination IP (since we are sending to the same dest)
- Differentiated Services (since all packets are ICMP they use the same Type of Service class)
- Upper Layer Protocol (since these are ICMP packets)

- g) Find the first ICMP Echo Request message that was sent by your computer after you changed the *Packet Size* to 2000 (Use command `ping -s 2000 www.msrit.edu` to change the MTU of the packet). Has that message been fragmented across more than one IP datagram

```

- i) What information in the IP header indicates that this is not the first datagram fragment? Are there more fragments? How can you tell? What fields change in the IP header between the first and second fragment?

Answer: We can tell that this is not the first fragment, since the fragment offset is 1480. It is the last fragment, since the more fragments flag is not set.

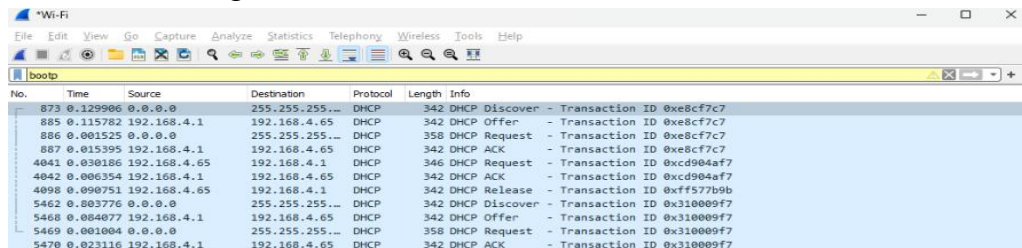

Lab Session 4

Problem Statement: Trace Dynamic Host Configuration Protocol using Wireshark.

Exercise Question with Solution:

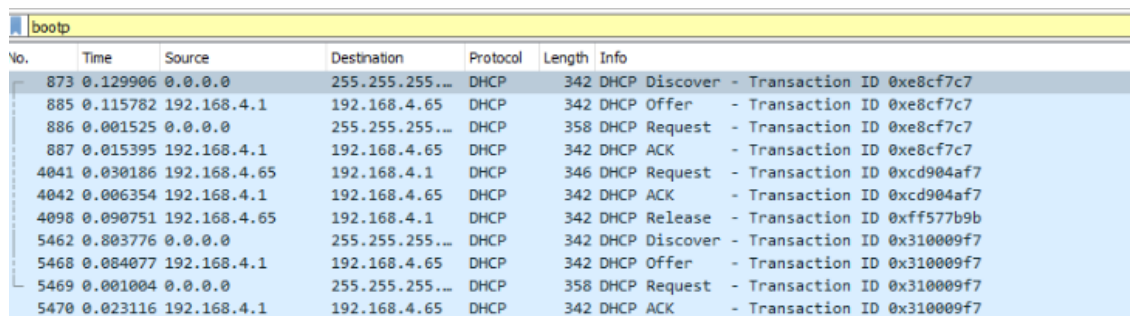

Use `dhclient -r` for releasing ip address, `dhclient <eth0>` for renewing ipaddress

- a) Are DHCP messages sent over UDP or TCP?

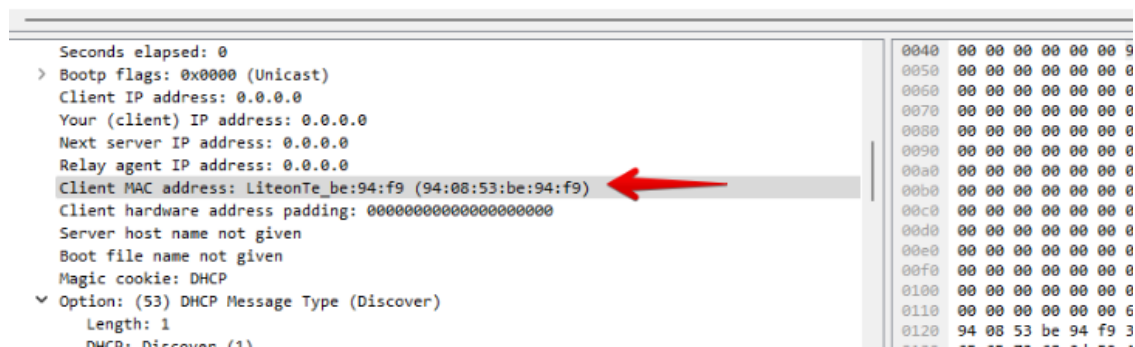

No.	Time	Source	Destination	Protocol	Length	Info
873	0.129906	0.0.0.0	255.255.255...	DHCP	342	DHCP Discover - Transaction ID 0xe8cf7c7

- d) What is the value of the Transaction-ID in each of the first four discover/Offer/Request/ACK) DHCP messages? What are the values of the Transaction-ID in the second set (Request/ACK) set of DHCP messages? What is the purpose of the Transaction-ID field?

- The client selects the **transaction ID** (xid) (often at random), and the server copies it in the answers. It serves a client-specific purpose, often enabling the client to identify the related dhcp answer to each request.

No.	Time	Source	Destination	Protocol	Length	Info

- e) A host uses DHCP to obtain an IP address, among other things. But a host's IP address is not confirmed until the end of the four-message exchange! If the IP address is not set until the end of the four-message exchange, then what values are used in the IP datagrams in the four-message exchange? For each of the four DHCP messages (Discover/Offer/Request/ACK DHCP), indicate the source and destination IP addresses that are carried in the encapsulating IP datagram.

DHCP Message	Who Sends It?	Destination	Purpose
DHCP Discover	Client	Broadcast (255.255.255.255)	Find available DHCP servers
DHCP Offer	Server	Broadcast or Unicast	Offer an IP lease
DHCP Request	Client	Broadcast or Server	Request a specific IP
DHCP ACK	Server	Unicast or Broadcast	Confirm the lease

No.	Time	Source	Destination	Protocol	Length	Info

- i) Explain the purpose of the lease time. How long is the lease time in your experiment?

Lease time refers to the duration for which a network device is assigned a specific IP address by a DHCP server.

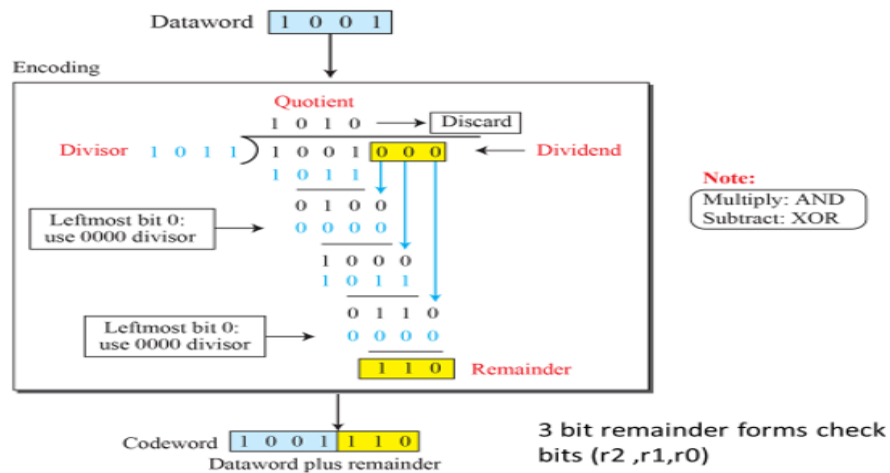

IP Address -172.1.6.1

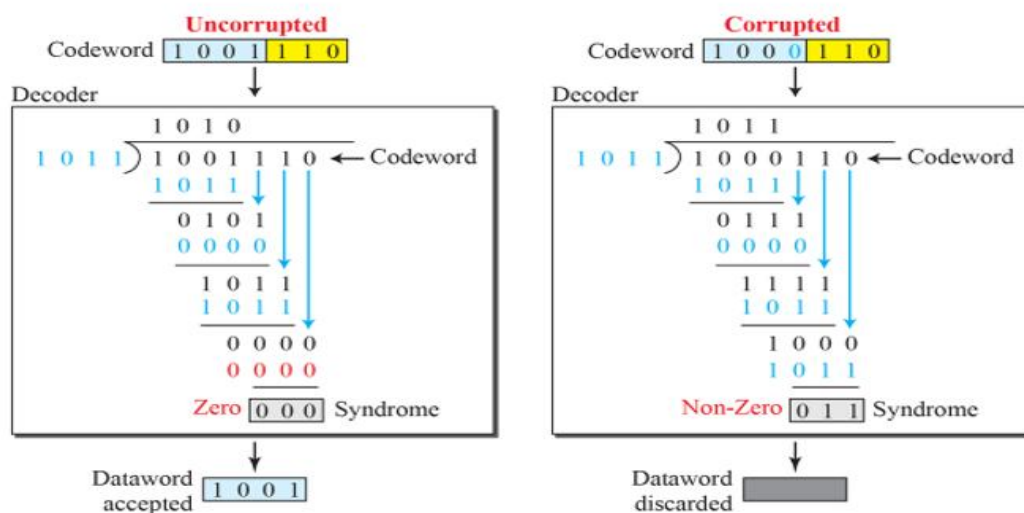

- j) What is the purpose of the DHCP release message? Does the DHCP server issue an acknowledgment of receipt of the client's DHCP request?
- DHCP Release Message is the request to release the IP back to the DHCP Server.
 - There is no ACK for this.
 - Nothing happens if the release message is lost. The client will continue operation until its IP lease expires.
- k) Explain the purpose of the router and subnet mask lines in the DHCP offer message.
- The router line indicates where the client should send messages by default.
 - The subnet mask line tells the client which subnet mask to use.
- l) Clear the *bootp* filter from your Wireshark window. Were any ARP packets sent or received during the DHCP packet-exchange period? If so, explain the purpose of those ARP packets.
- Yes there numerous ARP messages sent out in my trace.
 - An ARP request is sent when a device needs a MAC address associated with an IP address, and it does not have an entry for the IP address in its ARP table. This is used to map MACs to IPs in the local network

Lab Session 5

Write a program for error detection using CRC-CCITT(16-bits).

Division in CRC encoder

Division in the CRC decoder for two cases

Code:

```
import java.util.Scanner;
import java.io.*;

public class CRC1
{
    public static void main(String args[])
    {
        Scanner sc = new Scanner(System.in);           //Input Data Stream
        System.out.print("Enter message bits: ");
        String message = sc.nextLine();
        System.out.print("Enter generator: ");
    }
}
```

```

String generator = sc.nextLine();
int data[] = new int[message.length() + generator.length() - 1];
int divisor[] = new int[generator.length()];
for(int i=0;i<message.length();i++)
data[i] = Integer.parseInt(message.charAt(i)+"");
for(int i=0;i<generator.length();i++)
divisor[i] = Integer.parseInt(generator.charAt(i)+"");
//Calculation of CRC
for(int i=0;i<message.length();i++)
{
    if(data[i]==1)
        for(int j=0;j<divisor.length;j++)
            data[i+j] ^= divisor[j];
}
//Display CRC
System.out.print("The checksum code is: ");
for(int i=0;i<message.length();i++)
data[i] = Integer.parseInt(message.charAt(i)+"");
for(int i=0;i<data.length;i++)
System.out.print(data[i]);
System.out.println();

//Check for input CRC code
System.out.print("Enter checksum code: ");
message = sc.nextLine();
System.out.print("Enter generator: ");
generator = sc.nextLine();
data = new int[message.length() + generator.length() - 1];
divisor = new int[generator.length()];
for(int i=0;i<message.length();i++)
data[i] = Integer.parseInt(message.charAt(i)+"");
for(int i=0;i<generator.length();i++)
divisor[i] = Integer.parseInt(generator.charAt(i)+"");

//Calculation of remainder
for(int i=0;i<message.length();i++)

```

```

        {
            if(data[i]==1)
                for(int j=0;j<divisor.length;j++)
                    data[i+j] ^= divisor[j];
        }

//Display validity of data
boolean valid = true;
for(int i=0;i<data.length;i++)
    if(data[i]==1)
    {
        valid = false;
        break;
    }
    if(valid==true)
        System.out.println("Data stream is valid");
    else
        System.out.println("Data stream is invalid. CRC error occurred.");
}
}

```

Output:

Enter message bits: 100010101

Enter generator: 1001

The checksum code is: 100010101011

Enter checksum code: 100010101011

Enter generator: 1001

Data stream is valid

Enter message bits: 1001010101

Enter generator: 1011

The checksum code is: 1001010101110

Enter checksum code: 1001010101111

Enter generator: 1011

Data stream is invalid. CRC error occurred.

Lab Session 6

Write a program to find the shortest path between vertices using Bellman-Ford algorithm.

Solution:

- Single source shortest path algorithm.
- Dijkstras Algorithm :
 - Cannot handle negative weight.

Example :

N-1 times (4 times)

if($d[u] + c(u,v) < d[v]$)

$d[v] = d[u] + c(u,v)$

$d[u]$ = source

$c(u,v)$ = cost between u and v

$d[v]$ = destination

1st iteration

2nd iteration

3rd iteration

- Same in iteration 3 & 4.
- Loop = $n-1 = 4$

Distance:

$1 - 1 \rightarrow 0$

$1 - 2 \rightarrow 3$

$1 - 3 \rightarrow 5$

$1 - 4 \rightarrow 2$

$1 - 5 \rightarrow 5$

Disadvantage :

- It cannot give shortest path when the graph has negative cycle.
- Example : $7+7-15 = -1$
- In code: value changes even after $n-1$ loop.

Code:

```
import java.util.Scanner;

public class ford
{
    private int D[];
    private int num_ver;
```

When source and destination parameter are same, so to indicate which parameter to use.

```

    public static final int MAX_VALUE = 999;

    public ford(int num_ver)
    {
        this.num_ver = num_ver;
        D = new int[num_ver + 1];
    }

    public void BellmanFordEvaluation(int source, int A[][])
    {
        for (int node = 1; node <= num_ver; node++)
        {
            D[node] = MAX_VALUE;
        }
        D[source] = 0;
        for(int node = 1; node <= num_ver - 1; node++)
        {
            for (int sn = 1; sn <= num_ver; sn++)
            {
                for (int dn = 1; dn <= num_ver; dn++)
                {
                    if (A[sn][dn] != MAX_VALUE)
                    {
                        if (D[dn] > D[sn] + A[sn][dn])
                        {
                            D[dn] = D[sn] + A[sn][dn];
                        }
                    }
                }
            }
        }

        for(int sn = 1; sn <= num_ver; sn++)
        {
            for(int dn = 1; dn <= num_ver; dn++)
            {
                if(A[sn][dn] != MAX_VALUE)
                {
                    if (D[dn] > D[sn] + A[sn][dn])
                    {
                        System.out.println("The Graph contains negative edge cycle");
                    }
                }
            }
        }
    }

    for (int vertex = 1; vertex <= num_ver; vertex++)
    {
        System.out.println("distance of source"+source+"to"+vertex+"is" + D[vertex]);
    }
}

```

Check condition and update.

Checking for negative cycle.

Printing distance from source to destination.

```

public static void main(String[ ] args)
{
    int num_ver = 0;
    int source;

    Scanner scanner = new Scanner(System.in);
    System.out.println("Enter the number of vertices");
    num_ver = scanner.nextInt();
    int A[][] = new int[num_ver + 1][num_ver + 1];
    System.out.println("Enter the adjacency matrix");
    for (int sn = 1; sn <= num_ver; sn++)
    {
        for (int dn = 1; dn <= num_ver; dn++)
        {
            A[sn][dn] = scanner.nextInt();
            if (sn == dn)
            {
                A[sn][dn] = 0;
                continue;
            }

            if (A[sn][dn] == 0)
            {
                A[sn][dn] = MAX_VALUE;
            }
        }
    }

    System.out.println("Enter the source vertex");
    source = scanner.nextInt();
    ford b = new ford (num_ver);
    b.BellmanFordEvaluation(source, A);
    scanner.close();
}

```

//Scanning no of vertices = n = 5

	1	2	3	4	5
1	0	6	5	0	0
2	0	0	0	-1	0
3	0	-2	0	4	3
4	0	0	0	0	3
5	0	0	0	0	0

Lab Session 7

Write a program for congestion control using leaky bucket algorithm.

Solution:

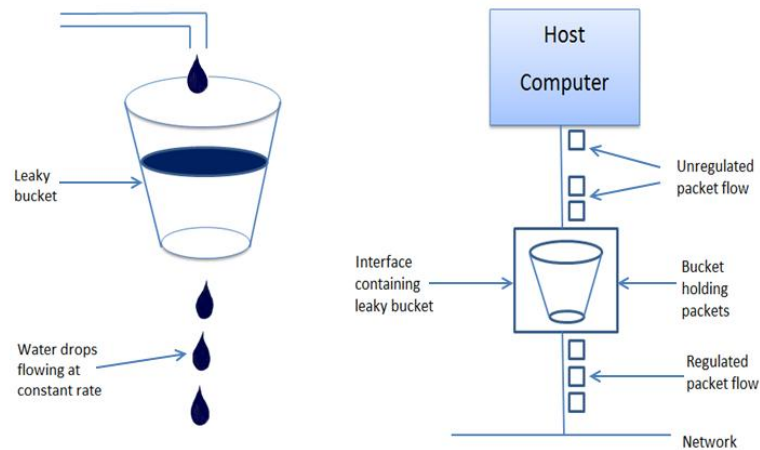

Fig: Leaky Bucket Algorithm

What is Leaky Bucket

- There is a bucket with a hole at the bottom.
- Water will be pouring into the bucket from the top.
- Water flows out at a constant rate irrespective of input of water into the bucket.

Lets apply the same concept to our network bucket.

- Tap \rightarrow Host Computer
- Water flow \rightarrow unregulated packet flow.
- Bucket \rightarrow Interface

Result:

- Packet Size beyond capacity \rightarrow Dropped
- Packet Size within the capacity \rightarrow Accept

Example:

Initially the bucket is empty : Remaining = 0, Bucket Capacity = 4, Rate = 3

I	A[i]	Accept by Bucket	Sent	Remaining
1	2	2	2	0
2	4	4	3	1
3	1	1	2	0
4	5	Dropped	0	0
5	3	3	3	0

Code:

```
import java.util.Scanner;
import java.lang.*;
public class LeakyBucket
{
    public static void main(String[] args)
    {
        int i;
        int a[]=new int[20];
        int buck_rem=0,buck_cap=4,rate=3,sent,recv;
        Scanner in = new Scanner(System.in);
        System.out.println("Enter the number of packets");
        int n = in.nextInt();
        System.out.println("Enter the packets");
        for(i=1;i<=n;i++)
            a[i]= in.nextInt();
        System.out.println("Clock \t packet size \t accept \t sent \t remaining");
        for(i=1;i<=n;i++)
        {
            if(a[i]!=0)
            {
                if(buck_rem+a[i]>buck_cap)
                    recv=-1;
                else
                {
                    recv=a[i]; buck_rem+=a[i];
                }
            }
            else recv=0;
            if(buck_rem!=0)
            {
                if(buck_rem<rate)
                {
                    sent=buck_rem; buck_rem=0;
                }
                else
                {
                    sent=rate;
                    buck_rem=buck_rem-rate;
                }
            }
            else
```

```
        sent=0;
    if(recv==-1)
        System.out.println(+i+ "\t\t" +a[i]+ "\t dropped \t" + sent +"\t" +buck_rem); else
        System.out.println(+i+ "\t\t" +a[i] +"\t\t" +recv +"\t" +sent + "\t" +buck_rem);
    }
}
```

Cycle – 2

Lab Session 8

Using TCP/IP sockets, write a client – server program where the client send the file name and the server send back the contents of the requested file if present.

Solution:

Socket Programming:

- Socket programming is a way of connecting two nodes on a network to communicate with each other.
- One socket(node) listens on a particular port at an IP, while the other socket reaches out to the other to form a connection.

How to use sockets?

- Set up a socket.
- Send and Receive the packets.
- Close the socket.

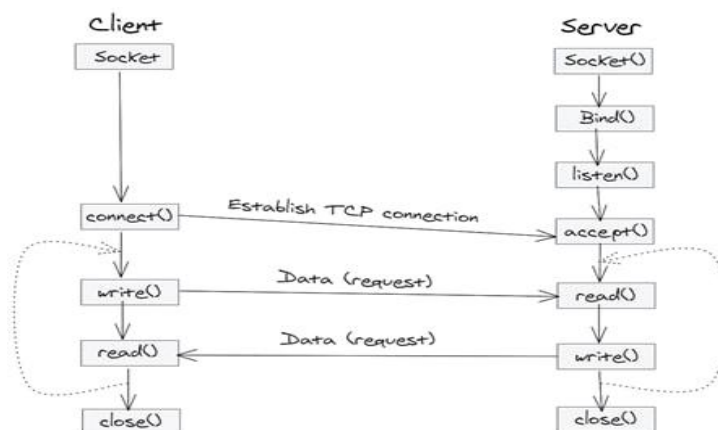

Typical Server Program Using TCP:

- Set up a Socket (Prepare to communicate)
- Wait to hear from a client
- Send and receive packets (Exchange data with the client over the new socket s_new)

Typical Client Program Using TCP:

- Set up a Socket (Prepare to communicate)
 - Create a socket
 - Determine server IP address and port number
 - Initiate the connection to the server
- Send and receive packets (Exchange data with the server)
 - Write data (i.e., request) to the socket
 - Read data (i.e., response) from the socket
 - Do stuff with the data (e.g., display a Web page)
- Close the socket.

STATE DIAGRAM:

Code: Client.java:

```
import java.net.*;
import java.io.*;
public class TCPC
{
    public static void main(String[] args) throws Exception
    {
        Socket sock=new Socket("127.0.01",4000);
        System.out.println("Enter the filename");
        BufferedReader keyRead=new BufferedReader(new InputStreamReader(System.in));
        String fname=keyRead.readLine();
        OutputStream ostream=sock.getOutputStream();
        PrintWriter pwrite=new PrintWriter(ostream,true);
        pwrite.println(fname);
        InputStream istream=sock.getInputStream();
        BufferedReader socketRead=new BufferedReader(new InputStreamReader(istream));
        String str;
        while((str=socketRead.readLine())!=null)
        {
            System.out.println(str);
        }
        pwrite.close();
        socketRead.close();
        keyRead.close();
    }
}
```

Code: Server.java

```
import java.net.*;
import java.io.*;
public class TCPS
{
    public static void main(String[] args) throws Exception
    {
        ServerSocket sersock=new ServerSocket(4000);
        System.out.println("Server ready for connection");
        Socket sock=sersock.accept();
        System.out.println("Connection Is successful and waiting for chatting");
        InputStream istream=sock.getInputStream();
```

```

        BufferedReader fileRead=new BufferedReader(new InputStreamReader(istream));
        String fname=fileRead.readLine();
        BufferedReader ContentRead=new BufferedReader(new FileReader(fname));
        OutputStream ostream=sock.getOutputStream();
        PrintWriter pwrite=new PrintWriter(ostream,true);
        String str;
        while((str=ContentRead.readLine())!=null){
            pwrite.println(str);
        }
        sock.close();
        sersock.close();
        pwrite.close();
        fileRead.close();
        ContentRead.close();
    }
}

```

Lab Session 9

Write a program for Time Division Multiplexing Simulator. Show how the time division multiplexing technique works.

Solution:

- In TDM, the data flow of each input stream is divided into units. One unit may be 1 bit, 1 byte, or a block of few bytes.
- Each input unit is allotted an input time slot. One input unit corresponds to one output unit and is allotted an output time slot.
- During transmission, one unit of each of the input streams is allotted one-time slot, periodically, in a sequence, on a rotational basis. This system is popularly called round-robin system. Example Consider a system having four input streams, A, B, C and D.
- Each of the data streams is divided into units which are allocated time slots in the round – robin manner.
- Hence, the time slot 1 is allotted to A, slot 2 is allotted to B, slot 3 is allotted to C, slot 4 is allotted to D, slot 5 is allocated to A again, and this goes on till the data in all the streams are transmitted.

Code:

```
import java.util.Scanner;

public class TDM
{
    public static void main(String args[])
    {
        int n,i,qt,count=0,temp,sq=0,bt[],wt[],tat[],rem_bt[];
        float awt=0,atat=0;
        bt = new int[10];
        wt = new int[10];
        tat = new int[10];
        rem_bt = new int[10];
        Scanner s=new Scanner(System.in);
        System.out.print("Enter the number of stations (maximum 10) = ");
        n = s.nextInt();
        System.out.print("Enter the processing time for each channel\n");
        for (i=0;i<n;i++)
```

```

        {      System.out.print("S"+i+" = ");          //stations Input
                bt[i] = s.nextInt();
                rem_bt[i] = bt[i];
        }
        System.out.print("Enter the frame size: ");      // Frame size for each station
        qt = s.nextInt();
        while(true)
        {      for (i=0,count=0;i++)
                {      temp = qt;
                        if(rem_bt[i] == 0)
                        {      count++;
                                continue;
                        }
                        if(rem_bt[i]>qt)
                                rem_bt[i]= rem_bt[i] - qt;
                        else if(rem_bt[i]>=0)
                        {      temp = rem_bt[i];
                                rem_bt[i] = 0;
                        }
                        sq = sq + temp;
                        tat[i] = sq;
                }
                if(n == count)
                        break;
        }

        System.out.print("-----");
        System.out.print("\nStation\t Processing Time\t Completion Time\t Waiting Time\n");
        System.out.print("-----");
        for(i=0;i<n;i++)
        {      wt[i]=tat[i]-bt[i];
                awt=awt+wt[i];
                atat=atat+tat[i];
                System.out.print("\n \t"+(i+1)+"\t \t"+bt[i]+" \t \t "+tat[i]+" \t \t "+wt[i]+" \n");
        }

```

```
}  
}
```

OUTPUT:

Enter the number of stations (maximum 10) = 4

Enter the processing time for each channel

S0 = 4

S1 = 5

S2 = 3

S3 = 2

Enter the frame size: 2

Station	Processing Time	Completion Time	Waiting Time

1	4	10	6
2	5	14	9
3	3	13	10
4	2	8	6

Network Simulator – 3

NS-3 (Network Simulator 3) is a popular, open-source discrete-event network simulator used mainly for research and educational purposes. It's a **simulator** designed to model how computer networks behave. You can simulate **wired and wireless networks**, internet protocols, and network topologies without needing real hardware. Mainly used by researchers, network engineers, and students to test new protocols, network algorithms, or study network performance. Written mostly in C++, with Python bindings to make simulations easier to script.

Wireshark captures and analyzes *real* network traffic live or from files. **NS-3** simulates a network *in software* for experimentation and research without real hardware.

Installing NS-3 on Ubuntu/Linux

Step 1: Update packages and install prerequisites

Open a terminal and run:

- `sudo apt update`
- `sudo apt install gcc g++ python3 python3-dev python3-setuptools git mercurial qt5-default qtcreator cmake libc6-dev libc6 libc6-dev python3-pygraphviz python3-pip graphviz pkg-config`

Step 2: Download NS-3 source code

Go to your home directory or preferred folder:

- `cd ~`

Download the latest stable NS-3 release (replace version number as needed):

- `wget https://www.nsnam.org/releases/ns-allinone-3.39.tar.bz2`
- `tar xjf ns-allinone-3.39.tar.bz2`
- `cd ns-allinone-3.39`

Step 3: Build and install NS-3

Run the build script:

- `./build.py --enable-examples --enable-tests`

Step 4: Set environment variables

Once the build is done, go to the ns-3 directory:

- `cd ns-3.39`

You can test it by running: `./waf --run hello-simulator`

NS3

Lab Session 10

Problem Statement : Design and simulate a wired network with duplex links between 'n' nodes with CDR over UDP. Set the queue size vary the bandwidth and find the number of packets dropped.

File Path:

- ~/ns-allinone-3.xx/ns-3.xx/Example/traffic-control/
- You can find examples like traffic-control-simple.cc.
- Copy and Paste it in Scratch.
- Open Scratch and Rename the File.
- Open the Renamed File in Scratch

Code:

```
#include "ns3/applications-module.h"
#include "ns3/core-module.h"
#include "ns3/flow-monitor-module.h"
#include "ns3/internet-module.h"
#include "ns3/network-module.h"
#include "ns3/point-to-point-module.h"
#include "ns3/traffic-control-module.h"
